Food Delivery Business Intelligence & Executive Dashboard

148,541 Restaurants

100,000 Registered Users

₹98.7 Cr Transaction Value

148,670 Orders

552 Cities

EXECUTIVE SUMMARY & BUSINESS PROBLEM

A major food delivery marketplace connecting ~148,500 restaurants and 100,000 registered users required a single source of truth to answer key operational and revenue questions leadership asks. This project audited and rebuilt the data architecture end-to-end—fixing underlying relationships, data types, duplicate records, and encoding errors—and delivered 31 business-ready KPI measures alongside a 6-page interactive dashboard.

CORE BUSINESS QUESTIONS ANSWERED

1. Revenue Dynamics

Where is revenue growing or shrinking, and what specific factors drive month-over-month performance shifts?

2. Underperformance Identification

Which specific restaurants, cuisines, and geographic cities are underperforming relative to their true market potential?

3. Customer Activation Gap

How many registered users have placed an order, and who represents our highest lifetime value customers?

4. Data Integrity & Trust

Are ratings correlated with volume, and is our underlying model trustworthy enough for executive decision-making?

KEY FINDINGS & BUSINESS IMPACT

1. High-Value Customer Activation Gap

Only **77.9% of registered users** (77,929 out of 100,000) have placed a single order—meaning roughly **22,000 acquired users have never converted**. Closing even one-third of this gap at the current Average Order Value (₹6,636) represents several Crore in recoverable revenue from existing users without spending on new marketing.

2. Restaurant Trust Signal Deficit

Only **41.4% of onboarded restaurants** (61,441 of 148,541) have active customer ratings. Nearly 6 in 10 restaurants are invisible to customers filtering by reviews—presenting a direct lever for conversion growth if post-order feedback prompts are expanded.

DATA ARCHITECTURE & INTEGRITY CORRECTIONS

- **Relational Mapping Correction:** Fixed a critical data model flaw where revenue was mapped to restaurants using raw file row order rather than unique Restaurant IDs. This eliminated silent misattribution errors across all city and restaurant performance views.
- **Clean Order Baseline:** Following comprehensive cleaning, only **1.07% of orders** contained invalid/negative amounts and **1.08%** lacked valid restaurant links, ensuring all executive KPIs rest on high-quality data.
- **Data Boundary Definition:** Identified that menu and pricing data is captured for **8.3% of restaurants** (~12,300 of 148,541). Menu and cuisine insights are explicitly flagged as directional to protect analytical rigor.

DASHBOARD ARCHITECTURE

Dashboard Page	Core Business Question & Analytical Focus
Executive Overview	High-level business performance summary, macro trends, and critical operational risks.
Sales & Revenue	Month-over-month revenue drivers, order volume shifts, and seasonal growth trajectory.
Restaurant Performance	Platform earnings rankings, category leaders, and customer rating correlation analysis.
Geography	Regional order distribution, geographic footprint across 552 cities, and tier expansion zones.
Customers	Activation funnel analysis, order frequency distribution, and high-value customer segmentation.
Menu & Pricing	Price point analysis and cuisine mix (evaluated within defined coverage boundaries).

TECHNICAL IMPLEMENTATION & STACK

- **Data Transformation:** Power Query ETL for data cleaning, type enforcement, and relationship normalization.
- **Data Modeling:** Star-schema layout featuring explicit date dimensions for time-intelligence reporting.
- **DAX Measure Repository:** Created 31 custom DAX measures organized in a dedicated measures table.
